Introduction

Managers and Executives want to do a good job, but much too often, their mind frame of reference and the organizational environment they work in gets in their way. At a minimum, this wastes people's talents and energies, and puts impossible loads on executives. At the worst, it induces people to perform poorly, work at cross purposes, fight with one another, and burn out.

Most of what we call management consists of making it difficult for people to get their work done.

Meanwhile, organizations are facing tough challenges from their competition and from a volatile, complex business environment. If everyone in an organization isn't doing everything possible to assure its success, the organization is doomed to mediocrity or even failure.

Executives really want to build effective organizations. They care about their organization's success and about the people who work for them. This is why they repeatedly attempt new ideas such as T.Q.M., B.P.R., empowerment, flattening, self-directed teams . . . . And repeatedly they are frustrated when nothing seems to make much of a difference.

Meanwhile, people get cynical when their leaders experiment with a seemingly disjointed series of changes, each of which is implemented half-heartedly and does little good.

This book describes a straightforward approach to building a strong organization and managing people as well as managing oneself -- ones in which everybody's talents are fully engaged and their independent actions are well orchestrated. It is a handbook for executives who are disappointed with quick fixes, jaded about management fads, and fed up with solving the same problems day after day . . . for leaders who are tired of fighting alligators and ready to drain the swamp.

. . . . .

Peter F. Drucker have defined management as a practice rather than a science. He advised everyone from Henry Luce to Margaret Thatcher to late Jack Welch. Winston Churchill says that the amazing thing about Drucker was his ability to start our minds along a stimulating line of thought.

No one influenced as many managers as Peter F. Drucker.

Jack Welch said that he persistently asked me a couple of questions that I had to keep asking myself to be successful:

- If you weren't in this business today, would you invest in it? And if not, what are you going to do about it? This led to our being number one or two in every business we were in and our reinventing ourselves every three years –

critical to our success.

- Is this important to your organization? If not, find somebody for whom this is the front-line and let them do it." It wasn't coincidence, Welch said, that soon after that he started working with information and programming teams in India. And he did it "twenty years before anyone else."

Peter was passionate about the need for good management. Peter F. Drucker defined the discipline of management; and then he re-defined the discipline of management. He created a vocabulary that we, and millions of others, are using today.

The first responsibility of a leader is to define responsibility. The last is to say thank you. In between, the leader is a servant.

Max De Pree

The best way we can thank Peter Ferdinand Drucker is to follow his example – step up, look outside, ask questions, test ideas against history, and encourage others to do what needs to be done. And to do it with a strong moral compass. That is our great opportunity.

In this book we have put in lots of hard work and time to make this book as user-friendly as possible, but we have not sacrificed quality. We highlight the most important and crucial points in

management people and the organization, and how leaders ought to work in these unprecedented challenges of the new business world and workplace. However, his thoughts and principles are explained in easy language for you. We sincerely hope this book will help you in every way you expect.

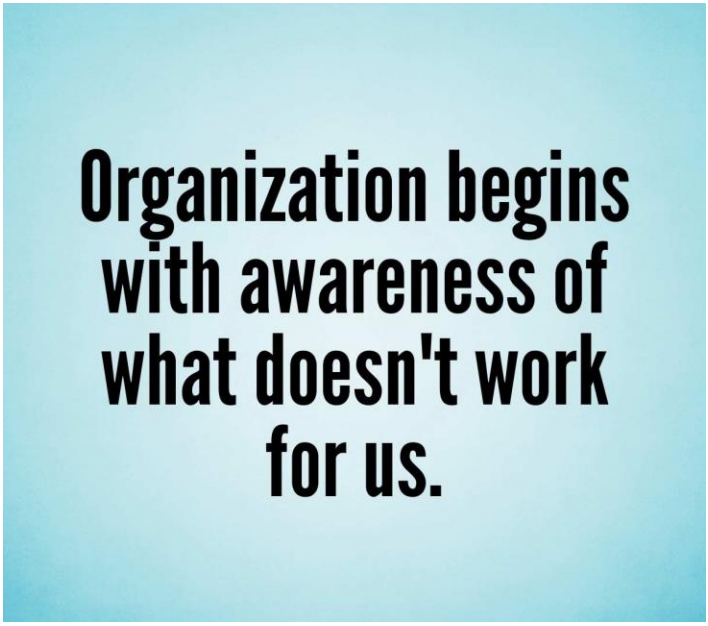

Enjoy reading from us!

Part I

The Organization

The Changes

Management expert Peter Drucker has had a profound influence on the field of knowledge management since its inception in the 1980s. His 1988 article The Coming of the New Organization provided an impressive set of predictions for the rise to prominence of knowledge within organizations. Drucker has accurately chronicled the shift toward a knowledge-oriented economy.

In The Coming of the New Organization Drucker argued that the traditional hierarchical model of organizational structure would change in the coming years. Flatter, specialized operations would dominate. These would bear a greater resemblance to organizations that have specialized in knowledge for centuries, such as universities and hospitals. This transition, argued Drucker, would involve shedding layers of management, as workers gained altogether different concerns and responsibilities. Drucker also argued that specialists rather than traditional departments would perform much of the work, and coordination and discipline would be the responsibility of individuals rather than management.

Therefore, we start by examining into how to set organizations to deal with this constant changed world, let us take a look of the new demands being placed on organizations. What, precisely, is expected of a successful organization in this tough

business environment? Or, put another way, exactly what is meant by the widely used term, "World Class"? Since every organization offers a unique service or product line, world-class performance must be defined at a level higher than specific deliverables. It means superior performance in every aspect of its work.

In the most general sense, there are two types of performance: (1) efficiency in routine operational tasks gained through productivity improvements and cost savings, and (2) effectiveness in creative tasks reflected in quality, flexibility, customer focus, and innovation. Both must be delivered year after year in a rapidly changing business environment.

This definition of performance, while comprehensive, is still vague. To take it to the next level of detail, consider the expectations arising from five fundamental changes in the business environment:

- Agility: A volatile business environment demands that organizations be capable of rapid shifts in their strategies, as well as of commitment to traditional long-term visions.
- Intimacy: Clients expect their suppliers to invest in partnerships, to know them well, and to contribute directly to their strategies.
- Diversity: While people have in common many aspects of their administrative work, missions are diverse; and based on their unique missions, individuals and small groups sign

up for unique business strategies. This means that organizations must tailor their offerings to each unique client.

- Competitiveness: Increased competition means that organizations must learn to do traditional tasks much more efficiently and better.
- Competence: The competition for talented employees has grown fierce, and attracting and retaining good people is extremely difficult.

Each of these changes in the business environment demands new levels of performance from organizations.

Agility

With the volatile nature of business strategy, long-term plans are obsolete shortly after they are written. Over-emphasis on planning can damage an organization's responsiveness. Instead, organizations must learn to grab windows of opportunity and formulate strategies on the fly. Strategic planning must not be a once-a-year event; it must be a continual, dynamic process.

Flexibility must extend to an organization's finances and capacity. If clients want to spend more than was planned, a world-class organization expands its supply to match funded demand.

In the short term, capacity can generally be augmented through the use of vendors and contractors. In the long term, every organization must forecast its market and develop its infrastructure

in advance of clients' demands. If capacity is not expanded, clients will either resent the organization as a constraint to their businesses, or they will simply take their money elsewhere.

And, of course, a fast-paced world demands a high pace of innovation. In order to beat their competitors to market with new concepts and technologies, most organizations must reduce the time from ideas to marketable products the cycle time.

Intimacy

Clients expect a close partnership with their suppliers -- a relationship built on service and mutual respect. Strategic partnerships extend beyond a simple commitment to doing business together. In partnerships, suppliers are expected to contribute directly to clients' business strategies.

First and foremost, a world-class organization must serve, not control, its clients. While this is obvious to companies which must compete in the open market for business, internal service functions often attempt to use monopolies and policies to disempower business units. A world-class service function, on the other hand, guides clients by earning their business and their respect, not by inhibiting or opposing them.

An organization must lift clients' vision of the business value of its products and services, and help clients understand how to use its products and services in a strategic manner. This amounts to a

marketing mission, as relevant to internal service functions as it is to whole companies.

An organization must help individual clients diagnose their business strategies and discover high-payoff opportunities to apply its products and services. Too often, organizations settle into a comfortable "order-taking" mentality. But it's not enough to satisfy clients' demands. Value is created at the very beginning, before a job is defined, when clients decide what products and services to buy and how to use them.

An organization can ensure its strategic alignment by actively facilitating this initial diagnostic process. It must help clients discover strategic applications, envision new business strategies enabled by their products, and justify investments based on strategic value not just cost savings.

Note that this does not mean that an organization should decide on behalf of clients' what products and services to produce. A world-class organization proactively helps clients discover opportunities for themselves, and then responds to their purchase decisions.

Finding a linkage between clients' business strategies and an organization's products is, essentially, sales in the very best sense of the profession. Sales is as relevant to an internal service department as it is to any business as a whole. Both must proactively help clients succeed by facilitating a strategy-driven discovery process.

An organization can also add value by helping various clients discover common interests, and facilitating the formation of client consortia to share solutions. This not only saves clients' money; it builds synergies among business units.

To help clients make the best use of its products and services, an organization is expected to support its product line with training, customer service, and repair. Furthermore, as strategic partnerships grow, clients expect added-value services that give them a competitive advantage, such as just-in-time delivery or custom electronic data interchange.

In other words, clients demand mass customization -- i.e., the quality and service of custom products at the price of mass production. Of course, an organization must form clear agreements (contracts) with clients, and must fulfill every agreement. To meet every commitment, it must never make a commitment it cannot keep.

Since clients are the beneficiaries, they must take responsibility for justifying the products and services they use. Within corporations, a service function must help clients defend the budget for its products and services even if the budget is channeled directly to the service organization.

Similarly, an internal service function must help clients set priorities within its available resources. Too often, internal service departments are given a fixed budget and then expected to do everything clients ask of them all year. Of course, this is

impossible, and clients become frustrated with staff deciding priorities and repeatedly telling them no.

A world-class organization makes clear to client's what resources are available to them, and then helps clients make purchase decisions within available resources.

Diversity

Each corporation has a unique position in its market, and hence a unique set of strategies. Furthermore, each client has a unique mission, and hence a unique role in the corporation's strategies. To align with clients' strategies, organizations must focus on what is different about clients, not what they all have in common.

Organizations must dispel the "one-size-fits-all" mentality. Common solutions address common problems, and typically all that every client has in common is administrative work. To deliver strategic value, an organization must customize solutions to fit clients' unique needs, rather than just build commodity or companywide solutions. Tailoring products and services is essential to strategic alignment.

To respond to unique clients' needs, an organization is expected to offer a broad product line. Providers that wish to remain their customers' primary source have no choice but to be full-service vendors that offer the broadest possible range of

products and services. If the product line is limited, clients will develop the habit of buying from competitors.

Furthermore, a limited product line forces an organization to become "a solution in search of a problem." Conversely, organizations that offer a broad range of products can focus on solving clients' business problems in a business-driven rather than product-driven manner, and provide whatever products are needed to address their clients' unique needs.

Similarly, offering a range of qualities and levels of value allows clients to select a price-point appropriate to their needs.

Even in small organizations, a broad product line is essential. Of course, it's quite all right to broaden one's product line through partnerships with vendors. This is far better than sending clients to competitors or appearing product driven. Beyond offering a diversity of products, when considering a particular client's request, an organization is expected to offer options. With each option, an organization must give clients all the information they need to choose. This is the opposite of an internal service function that makes decisions for its clients since "they know their profession best." It's the essence of customer focus.

Competitiveness

In addition to learning new skills to align themselves with clients' strategies, organizations must respond to increasing competitive pressures. Global competition is forcing once-complacent companies to dramatically increase their performance.

Similarly, internal service functions are facing tough competition in the form of outsourcing and decentralization, and can no longer rest on the laurels of past monopolies.

Clients' increasing reliance on partnerships brings increased scrutiny of their suppliers. Wal-Mart, for example, examines its suppliers' financial practices and makes "suggestions," such as the elimination of corporate jets and reductions in executive compensation, to bring their prices down.

Similarly, within corporations, everyone is interested in "helping" managers of internal service functions manage their businesses. Organizations can no longer say, "This is too complex for you to understand . . . . Leave the decision to us." Instead, it must run its businesses in an open, impeccable manner.

In increasingly competitive markets, every organization must find a way to "do more with less." It must do everything in its power to keep its prices (i.e., costs) competitive.

At the same time, amidst burgeoning technological change, an organization must proactively keep its products and services up to date. Continual investment in innovation is essential to delivering competitive value, and to staying in business.

In every product area, organizations are expected to offer world-class quality. Defects drive clients' costs up, and damage clients' reputations. While every product need not be "gold plated," quality must consistently meet clients' expectations.

One aspect of quality is product-line integration. Integration gives clients greater flexibility to mix-and-match products, and the ability to quickly change configurations as their business needs change. It also reduces support costs. Beyond cost savings, integration can create business synergies as an organization's products help clients collaborate with each other.

In spite of technological diversity and unique customer requirements, providers in most industries are expected to design products to work well together. In product design, an organization must both create diverse solutions and, at the same time, integrate its product line by utilizing standards and reusable components.

Competence

In every facet of business, greater complexity demands a greater degree and diversity of specialized talent. More than anything else, people create an organization's competitive advantage. To attract and retain a qualified staff, an organization is expected to provide a safe, supportive work environment. It must give people well-focused jobs that don't ask them to be experts at too many things at once. Jobs must be whole, such that people are accountable for product lines rather than roles or tasks.

And it must support staff in their professional growth with challenging work assignments and opportunities for professional development.

In Summary, the pace and complexity of business have grown by orders of magnitude. As a result, ever more is expected

of organizations -- of both entire businesses and the service functions within them.

Succeeding at strategic alignment in a volatile, competitive business environment requires dramatically higher levels of performance.

The above is just a sampling of the many performance expectations of competitive organizations. Both clients and staff are demanding things of organizations that were unimagined in the past.

Clearly, no organization can claim to be excellent at all these things. Nonetheless, this long list of demands is far from unrealistic. "World class" is not just a motivational slogan. Quantum leaps in performance are necessary to survival.

To prosper in turbulent times, organizations must limber up and get in shape. Businesses must learn to be flexible, opportunistic, and capable of numerous simultaneous initiatives.

▬▬

The Contradictions of Success

Responding to the current challenges of a tough business environment is not just a matter of working harder or more efficiently. a number of paradoxes or contradictions that force leaders to rethink the way organizations work.

Diversity and Integration

To offer a broad range of products amidst the burgeoning complexity of technologies, organizations must draw together experts in a far broader range of disciplines than ever before. In spite of this diversity, organizations must also integrate the various technological components into a coherent product line.

These two pressures are diametrically opposed. The more diverse the technologies, the tougher it is to integrate them.

Integration and Responsiveness

Organizations are expected to offer an integrated product line. The commonly suggested answer to the need for integration is a top-down "plan" that designs the entire product line all at once.

To do this, organizations scan the range of technologies and narrow them down to a subset that can be integrated.

At the same time, organizations are expected to deliver strategic value to their clients. Strategic solutions are, by necessity,

tailored (customized) to fit a particular client who has a unique mission and a unique business problem.

But top-down plans only address problems which everybody in the company or the market *shares.* Since only administrative challenges are common to everybody, top-down plans rarely result in products tailored to clients' specific strategic opportunities.

Furthermore, long-term plans don't respond to clients' rapidly changing business strategies. And yet, without planning, it's difficult to integrate an organization's various products. Organizations are expected to integrate diverse technologies, and simultaneously offer clients strategic solutions tailored to their unique, here-and-now needs. Again, these objectives appear paradoxical.

Saving Money and Investing

There is another paradox inherent in the focus on strategic value. Clients expect solutions that directly contribute in significant ways to their missions and the key business imperatives of the company strategic value, rather than just indirectly through administrative cost savings.

Yet, simultaneously, clients often question the return on investments in the organization's products. Their concern is natural. Success requires careful cost control, often steering people away from investments in lucrative areas of strategic opportunity a false economy. How can people view an organization's products as

strategic, and at the same time consider it a target for cost-reduction?

Business-Driven and Technology-Driven

Many high-tech organizations traditionally have been rich with technology gurus, but weak on business experts. The need for a focus on technology has not diminished. Organizations must be leaders in technology to generate new product opportunities. In fact, the need for technical excellence is greater than ever in the face of growing technological complexity and pace of change.

At the same time, organizations must be business-driven not technology-driven in their approach to clients. They must provide insights into the strategic use of their products, and design tailored solutions *after* fully understanding clients' business needs. Without significantly expanded business skills, the promise of strategic value will be elusive. Paradoxically, organizations must be both business-driven and technology-driven. These two very different perspectives require different skills and different kinds of people.

Success requires a careful balance of conflicting forces, and dynamic processes
that continually adjust the balances.

Change and Stability

Organizations must continually invent new products and manufacturing techniques. At the same time, they must keep existing operations stable and support existing customers efficiently. The invention process inevitably disrupts the smooth operations that benefit from stability. For this reason, it's quite rational for people who are responsible for stable operations to resist the fundamental changes brought about by new inventions.

Somehow, organizations must be both inventive and stable.

No Escape

As impossible as they might seem, these expectations represent the reality of today's business pressures. To survive in a competitive world, organizations cannot afford to fail at any of their often-conflicting missions.

Doing more of the same, somewhat more quickly and efficiently, will not address these paradoxes. Characteristically different organizational processes are needed to both pursue excellence in each area of endeavor, and, at the sometime, to continually adjust the balance of numerous paradoxical forces.

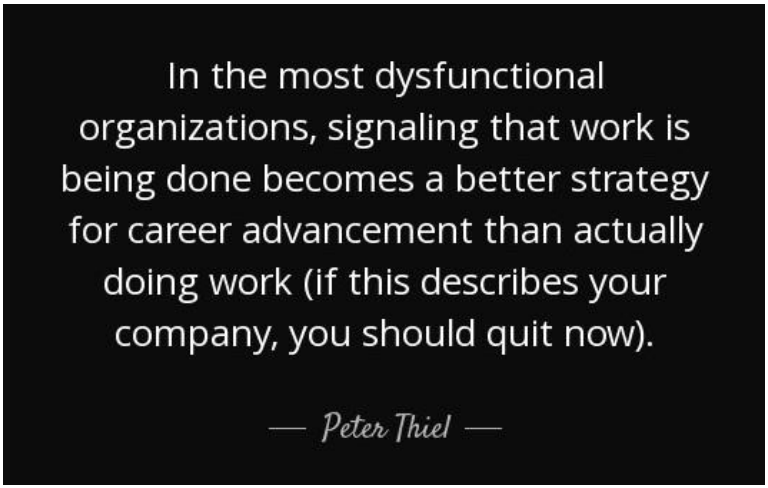

▬▬

The Healthy Organizations

The ability of an organization to perform efficiently and effectively is a fundamental issue irrespectively of its field of activity. With the tremendous pressures on today's organizations and the many tough and often paradoxical expectations they face, doing a good job is tougher than ever before. Unfortunately, few organizations are reliably performing well, year after year.

Good business leaders set out to do the right thing by their employees. They want their people to feel safe, to be treated fairly and with respect. They believe that professional conduct matters and that customer service is important. A great business makes this vision a reality because its leaders are honest and have strong moral principles. In other words, integrity comes first and this enables them to lead through trust.

The problem is not the people. Every organization has a range of talents. In addition, no organization can bet its future on hiring only super-achievers. The problem is not resources either. Increasing the budget of an organization is likely to produce more of the same, not new kinds of results. In addition, the problem is not technology.

A new tool or technique makes an organization more efficient at what it chooses to do, but it will not help an organization make the right choices. In fact, sometimes a new technology can make an organization very good at doing the wrong things. The problem is much deeper than any of these.

The problem just may be an obsolete organization!

What kind of organizations can handle the demands of a chaotic business environment? Or, put another way, what are the characteristics of a "healthy" organization?

Defining a Healthy Organization

First and foremost, healthy organizations do not waste any talent. Everyone is fully engaged. People feel accountable for a part of the business, and are in control of their business-within-a-business as empowered entrepreneurs.

Entrepreneurs are customer focused because they clearly understand that they must earn their clients' business to survive. Naturally, they focus on delivering results products rather than performing tasks. Since they think like entrepreneurs in a competitive market, everybody always looks for efficiencies and new ways to satisfy their customers.

Moreover, quality is a natural outcome because small groups of people are responsible for every aspect of producing specific products of the organization.

Well-designed, healthy organizations use every bit of their available talent.

Not only are people fully engaged, individually expressing their initiative and creativity as they work on a diversity of issues, but also people are well coordinated with one another. In healthy organizations, high-performance teamwork is a natural way of doing business.

Building a high trust organization comes from the top, starting with the most senior executive and translating through to the most junior employee. Leaders set and maintain standards for professional conduct through their own actions and behavior. This applies to their employees and customers alike. This is the human side to a brand, the one that we crave most, in a world where good

manners and fair play sometimes appear to be a distant second to growth and shareholder return.

Teams form spontaneously without the need for management intervention across organizational boundaries, because everybody is empowered to get the help they need from others. In this way, cross-boundary teams are self-forming, without waiting for management to assign staff to projects.

Since everybody knows just what help they need from others, teams involve just the right people at just the right time. Teams are not made of a fixed group for an entire project. Rather, people join teams for specific periods-of-time to contribute specific deliverables. In this way, a healthy organization always deploys its talents in the optimal way.

People ask others for help based on the unique needs of each project. The result: Processes are dynamic and tailored to the needs of each project, and everybody automatically plans the most efficient workflows.

This approach to teamwork is much more powerful than appointing a few "process owners" who disempower others by telling them how to do their jobs. In addition, it is much more flexible than a single business process for every occasion as in business process reengineering.

When seeking others' help, people contract for specific deliverables rather than just join my team. This ensures that people within teams are clear about their respective accountabilities.

Furthermore, the chain of command is well established, since everybody knows who their internal customers and suppliers are. Thus, there is no confusion about who is in charge. As a result, of clear accountabilities for results and a clear chain of command, teams are self-managing.

Trust is the ability for everyone in an organization to confidently rely on and predict that others will do the right thing. Appropriate behavior in the workplace develops trust and this enables the right types of conversations to take place. It overcomes uncertainty and doubt. It allows people to be the best they can be. If you want to become an employer of choice, you must first create a high trust organization.

In healthy organizations, high-performance teamwork is the normal way of doing business.

In addition, contracting for specific deliverables means that team members manage their own pieces of the project. Managing large projects is much easier, since project-management responsibilities are distributed. In short, high-performance teamwork is the normal way of doing business.

In a healthy organization, selflessness is not needed. When the signals that guide people's behavior are, well aligned, personal success is achieved precisely by doing what is best for clients and the organization as a whole. That includes working with others in the organization who bring unique skills and resources to the team.

With all its talent employed in a coordinated manner, healthy organizations achieve a dynamic balance among the various paradoxical objectives. Different perspectives take precedence at different times, as situations warrant.

For example, a well-established product line may require operational stability with continual, but marginal, product improvements. Operations may take the lead as the entrepreneurship that produces this particular product, and it subcontracts to designers for help with improvements.

On the other hand, a new product requires a flexible, inventive team. For this situation, designers may be in charge, while operations serves as their subcontractor.

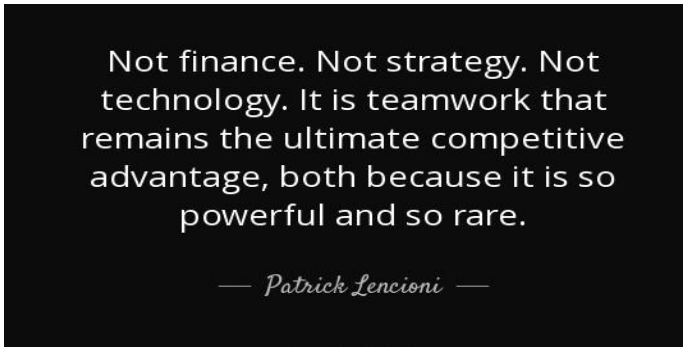

Healthy organizations focus everybody on the right issues at the right time,
and coordinate them with a minimal need for management intervention.

With a high degree of customer focus and flexible processes, healthy organizations are quick to adjust to changing client requirements and business strategies. By eliciting the best performance from every one of its members while coordinating their work, healthy organizations continually work at peak performance, continually adapt to a changing world, and continually evolve and improve themselves.

On the other hand, unhealthy organizations build conflicts into the very fabric of the work environment. They are filled with untenable jobs; fail to align people's efforts with clients' business needs, waste significant management time resolving internal political issues, and burn people out.

Organizations can make or break people

As critical as they are to people's success, rarely have organizations been consciously designed to handle today's multiplicity of often-conflicting objectives, and to maintain excellence in the face of ever-more-complex technologies and rapidly changing business needs.

It is not that organizational health is an executive's only concern. Certainly, every executive face problem, which are the result of causes other than organizational design, such as poor business strategies, inadequate resources and technologies, or incapable people.

Nevertheless, insightful strategies, adequate resources, innovative technologies, and great people do little good in unhealthy organizations. If dysfunctions are built into an organizational environment, other remedial actions will have little effect, since capable people may not put the remedies to good use.

Remember, it’s not what you do once or twice, it’s about what you do consistently each day, as a way of life, that makes all the difference. So be honest with yourself and use this as an opportunity to reflect on the day-to-day conversations that are happening at your workplace.

▬▬

Leaders Vs. Managers

Put simply, the model of the executive as a command-and-control-oriented "foreman" is obsolete. In a business environment that is rapidly changing on many fronts, there's never enough time for one person to know and manage everything. Under a foreman-style executive, the pace of an organization slows, and it cannot handle the diversity of challenges it faces.

A small step forward is the executive who empowers people and then solves problems as they arise. Most executives enjoy solving problems; it feels good to get something tangible done. But solving problems is not enough. Executives cannot afford to work example-at-a-time. If they focus on today's problems, they'll be too busy to figure out how to prevent future problems which, it seems, can always be postponed. Worse, they may become too close to the problems to see the "forest for the trees."

In addition to solving problems, executives must fix the organization so that similar problems do not recur, or at least do not rise to the executives' level.

Of course, there are times when executives must step into the day-to-day operations and fix a severe problem. But executives can never have enough time to solve every new problem. And executives who repeatedly "rescue the situation," and do no more, inevitably institutionalize their organizations' dependence on them.

Executives must also supervise people, a day-to-day task. "Growing" good people has a tremendous impact. But as important as it is, coaching individuals is painfully slow as a channel for change.

The problem with firefighting and people management is the lack of *leverage.* It may be fun to make tough decisions and lead the charge on critical projects. But that place far too much emphasis on only one mind: the executives.

The most effective executives tap *all* the bright minds in their organizations rather than depend solely on the one at the top. Effective executives empower people at every level while guiding them toward individual excellence and high-performance teamwork.

The most important job of an executive is to design and organization in which everyone can succeed.

This captures the essence of the word "leadership" -- in contrast to an executive's managerial duties. The managerial portion of the job is the time spent supervising people and doing the day-to-day work of the organization. The leadership portion is the time executives spend improving the way their organizations operate.

Managers supervise people and do the day-to-day work of organizations.

Leaders improve the way organizations do their day-to-day work.

Managers develop "strategic" plans that deal with the issues of the day. Leaders develop "meta-plans" that grow healthy organizations capable of dealing with the myriad strategic issues of today and tomorrow. Managers envision the future of the business. Leaders envision organizations that will deal with whatever the future may bring.

Managers fight alligators. Leaders drain the swamp.

To illustrate the difference between managers and leaders, imagine that you are concerned about your organization's lack of partnership with clients. You would like people to focus on clients' strategies rather than just on traditional operational issues. You determine that there are three key activities that will make or break the strategic value of your organization: opportunity identification, clients' priority setting, and project delivery.

Opportunity identification*:* While it may be tempting for you to personally work with client executives to identify their strategic needs, it would not be good leadership. Your organization would be limited to the few strategic projects that you can find in the little time you can afford to spend with individual clients.

As a leader, you might introduce methods to identify clients' strategic opportunities, then let the organization find them day after day. When the organization continually works to ensure alignment, the result is an avalanche of projects well focused on the unique strategic needs of each client.

Priority setting*:* An organization's bottom-line value to clients is directly related to its priority-setting processes. If it pursues low-payoff projects, there is little staff can do to align their efforts with clients' strategies.

Within a company, a service department's executive may feel well qualified to determine project priorities on behalf of the company, perhaps with the help of an advisory committee. Typically, such committees meet for a few hours each quarter, and don't have time to understand the hundreds of creative ideas generated throughout the company some of which cannot afford to wait months for a priority decision.

As a result, "hot" strategic projects may not get done. Or worse, priorities are set once a year in a "strategic plan," and the organization becomes unresponsive to changes in the business throughout the year.

A leader, on the other hand, designs processes whereby clients dynamically adjust priorities throughout the year. As a result, clients are in control of their purchases; decisions are based on clients' much better understanding of their unique business

needs; and priorities can shift as quickly as the business environment changes.

Similarly, vendors which help their clients become "smart buyers" of their products -- and understand the relative returns on various investments -- will deliver more value to their clients' bottom line than those which simply take orders.

Project delivery*:* In the past, the boss formed project teams and supervised their work. However, in a dynamic organization, dozens of projects are initiated each month. Each requires a unique mix of skills and a unique sequence of activities. The boss may not understand exactly what skills are needed when; and, without the right talent on each team, productivity will suffer.

Business process reengineering, while it may be a step forward, is still not leadership. Executives who reengineer the product-delivery process, for example, are working at the level of a super-project manager. They may design a work flow that is optimal in some cases, but it is bound to be inappropriate in others. Meanwhile, the flexibility of their organizations suffers.

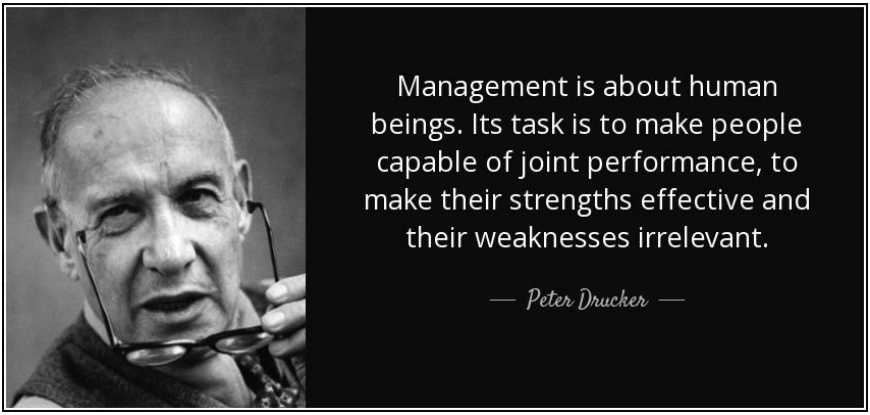

By contrast, a leader focuses on the "meta-processes" by which everybody forms teams across organizational boundaries and everybody determines the appropriate project-management processes. These meta-processes ensure that people throughout the organization assemble just the right people at just the right time to make just the right contributions. Meta-processes also let each

team tailor its work flow to fit the project's unique needs, and ensure that each team member has clear accountabilities.

In summary, managers focus on results, and do so day after day. Leaders focus on the organizational processes that enable everybody to produce results forevermore. Working at the leadership level leverages executives' time, and reduces the risk of executive bottlenecks.

Part II

The Druckerism

The Father of Modern Management

Late Professor Peter F Drucker was born in Vienna on November 19, 1909 and died on November 11, 2005. He was educated in Austria, Germany, and England. He started his career in Economics working for several German banks and export companies, and, at the same time, as economic journalist for Austrian and German newspapers and international banks in London. In 1929, he won a doctoral degree in Law at the University of Berlin.

Due to the rising German anti-Semitism after Hitler's coming to power in 1933, he left Germany and went to England, where he worked as a consultant for British banks and insurance companies. In 1938, he moved to the United States, starting his professional career as a consultant for American companies while still working as an economic journalist.

Industrial giants like General Motors, IBM, Caterpillar, Merck, and Hewlett Packard sought his advice. To this day, his commentaries in the British and American press are valued and cited for their critique and visionary content.

During World War II, he worked for the US State Department's intelligence. Also, during World War II, in 1942, he started his career as a university professor at Bennington College. From 1949, he read Management at the New York University for

two years, and since 1971 Social Sciences at the Claremont Graduate School in California. In the course of the years, it became, in the eyes of American and other universities, an honor to have a guest lectureship there.

Professor Drucker received 21 honorary degrees in the USA, England, Japan, Belgium, Switzerland, and Spain during this time. Today, he lives at Claremont together with his wife Doris.

In spite of his age, he still works as a university professor and author of management literature. He is also still a consultant for enterprises and the government.

In the scientific community, P F Drucker is considered the father of such concepts as Management by Objectives, Change Management, and Innovation Management. One can hardly find an author of management literature who does not respect Prof Drucker's work.

He was a member of many national and international associations like the American Association of Science, National Academy of Public Administration, American Academy of Arts and Sciences, Society for the History of Technology, American Academy of Management, British Academy of Management, and others.

Prof Drucker was also the author of inspiring economic, political and sociological contributions and of many articles in

magazines and journals. His books have become world bestsellers and have been translated into over 20 languages.

Druckerism

Druckerism is what Peter Drucker talked about management in general and how organizations, leaders, and managers ought to perform, behave and think that aims to improve businesses' operational efficiency and effectiveness. It was highly influential in varieties of organizations, shaping new thinking in managing corporations.

The late Peter F. Drucker (1909-2005) has been considered one of the twentieth-century's most prominent thinkers in the field of business and a major shaper of management thought.

Drucker's understanding of the work of management produced modern ideas for a distinct way of being a manager based on forgotten ideals and deep-rooted moral principles.

Drucker regarded the business corporation as a human organization, a social organization, a community and micro-society of the larger macro-society, in addition to being an economic entity.

Druckerism typically refers to the management philosophy and teachings of Peter Drucker. He was a renowned management consultant, educator, and author who is often considered the father of modern management.

His ideas and principles have had a profound impact on the field of management and business. Drucker emphasized the importance of effective management in organizations and the need for managers to focus on results. Some key principles associated with Druckerism include:

- Management by Objectives (MBO)
- Decentralization
- Knowledge Workers
- Customer-Centric Approach
- Continuous Learning
- Entrepreneurship and Innovation

Drucker's ideas have had a lasting impact on the practice of management, and many of his principles are still influential in today's business world. "Druckerism" is a way of encapsulating these management philosophies and practices associated with Peter Drucker.

▬▬

Thought 1 - On Leadership

Effective leadership is not about making speeches or being liked; leadership is defined by results not attributes.

Leadership is the art of influencing others to their maximum performance to accomplish any task, objective or project. Leadership is the lifting of a man's vision to higher sights, the raising of a man's performance to a higher standard, the building of a man's personality beyond its normal limitations.

A good deal of leadership in the winning of victories has to do with your ability to win the minds of the people around you. If you can do this, you'll not only lead successfully, but you'll be successful in achieving your goals and objectives. What we've seen is that the power of leadership is considerable.

The resources of your organization, top management actions, actions of adversaries, the abilities of people who you're responsible for or who are in your organization, or anything else are all secondary. They are secondary to your ability to help people do things that they didn't know they could do or didn't know needed to be done. To do this, you must first win their minds to

your way of thinking. But this doesn't depend on good deals for those you lead.

Five insights that form the basis for his philosophy of leadership:

- The leader's main work is strategy. The difference between a manager and a leader is that a manager focuses on doing things right, while a leader focuses on doing the right things. Figuring out the right things is the goal of strategy and devising strategy is a full-time job that should never be delegated to committees.
- Abiding by business ethics and maintaining personal integrity are prerequisites for leadership. Leadership is established through character and personal values that not be fenced off from business practices.
- The military offers the best lessons in leadership development. The military as a model for developing business leadership that emphasis on applied and practical training, and continual talent development and evaluation, follow-through and a rational system of promotion were highly effective.
- Effective leadership depends upon knowing what motivates people. Allowing employees to be self-directed and giving them responsibility — so-called Theory Y leadership — had merit in addition to the imposition of some authority and the provision of guidance.

- Leadership is really marketing. To explore the notion that workers — especially knowledge workers — are like customers or partners. It is the organization's job to figure out what they want and need and then satisfy those requirements.

Peter Drucker, didn't focus exclusively on leadership, his insights on management are highly relevant to leadership as well. Here are some key principles and ideas from Drucker that can be applied to leadership:

Management by Objectives (MBO): Drucker introduced the concept of Management by Objectives, which emphasizes setting clear goals and objectives for an organization. Leaders should work with their teams to establish measurable and achievable objectives, aligning individual and team efforts with the overall goals of the organization.

Results-Based Leadership: Drucker emphasized the importance of focusing on outcomes and results rather than just activities. Effective leaders should be outcome-oriented, concentrating on what needs to be achieved and guiding their teams toward those results.

Focus on Strengths: Drucker believed that effective leaders understand and leverage the strengths of individuals within their teams. Instead of trying to fix weaknesses, leaders should identify and capitalize on the strengths of their team members, creating a more productive and high-performing workforce.

Decentralization and Empowerment: Drucker advocated for decentralized decision-making and empowering employees. Leaders should distribute decision-making authority to those closest to the relevant information, enabling faster and more informed choices.

Continuous Learning: Drucker stressed the importance of continuous learning and personal development for leaders. Leaders should be committed to improving their skills, adapting to change, and staying ahead of emerging trends in their industry.

Effective Communication: Drucker emphasized the significance of clear and effective communication. Leaders should be able to communicate their vision, expectations, and feedback in a way that resonates with their team members.

Social Responsibility: Drucker believed that organizations and their leaders have a responsibility to society. Leaders should consider the broader impact of their decisions on employees, customers, and the community, and they should work towards responsible and ethical business practices.

Innovation and Entrepreneurship: Drucker was a proponent of innovation and entrepreneurship within organizations. Leaders should encourage a culture of creativity and risk-taking, fostering an environment where new ideas can flourish.

Time Management: Drucker emphasized the importance of effective time management. Leaders should prioritize tasks and

allocate their time to activities that align with organizational goals, avoiding time-wasting activities.

Adaptability: Drucker recognized the dynamic nature of the business environment. Leaders should be adaptable and able to navigate change effectively, guiding their teams through periods of uncertainty.

Highly successful businesses foster a safe workplace and encourage people at all levels to have honest conversations about the things that matter most. The workplace is free from bullying, harassment and discrimination and people feel they can speak up without the threat of negative repercussions or victimization. As a result, people trust each other and can strive to be their best, resulting in improved productivity, increased employee engagement and a noticeable shift in customer service.

In summary, Drucker's principles emphasize the importance of clear goals, results-oriented leadership, leveraging strengths, empowerment, continuous learning, effective communication, social responsibility, innovation, time management, and adaptability. Leaders who incorporate these principles into their approach can build more effective and sustainable organizations.

Thought 2 - On Communication

The most important thing in communication is to hear what isn't being said.

Drucker often spoke about the importance of communication as a management tool, but what do we mean by his statement “to communicate is to hear what is not being said”? Communicating is too often understood as a simple mode of expression in front of one or several target audiences, but communicating is much more than that: expression is only the visible, audible face of communication.

- Listen to and understand your audience’s expectations and barriers
- Identify its influences and codes
- Convince by exchanging to create adhesion
- Scanning your audience and finding your supporters
- Any successful communication starts by creating contact by listening to its audiences to know them.

The preliminary analysis of the different audiences and their components will aim at identifying the brakes that prevent them from adhering, the motivations that drive them, the competition

they may know, the needs they may have. This knowledge is essential to achieve the ultimate goal of any communication: the conviction of the other person and the emotion that we will transmit to him so that he remembers our essential message and makes the best use of it.

The more details you have on the socio-types of your audiences, the more you will know you're playing field. The exercise will be easier in internal communication because you know the profiles of your employees. But, in any case, whether you know your audience or not, the key will lie in listening, therefore in the questions you ask and the answers you give. By sowing a few commonly heard points of view here and there, you will see reactions or not and will thus know the motivations and the ambient brakes.

The attitude of your audience and their degree of attention will be weak signals that you will learn to see and use.

- Communication is perception
- Communication is expectation
- Communication makes demands
- Communication and information are different and indeed largely opposite—yet interdependent

Peter Drucker, a renowned management consultant, educator, and author, had valuable insights on various aspects of management, including communication. While he did not focus exclusively on communication in his works, his views on the

subject can be inferred from his broader discussions on effective management and organizational dynamics. Here are some key principles related to communication that can be attributed to Drucker:

Clarity and Simplicity

Drucker emphasized the importance of clear and simple communication. He believed that effective communication requires expressing ideas in a straightforward manner to avoid misunderstandings. Managers, according to Drucker, should strive for clarity in both verbal and written communication.

Listening

In Drucker's view, effective communication is a two-way street that involves not only conveying information but also actively listening. Managers should be attentive to the concerns, feedback, and ideas of their team members. Listening is a crucial component of understanding the dynamics within an organization and fostering a collaborative environment.

Communication as a Tool for Collaboration

Drucker saw communication as a means to facilitate collaboration within an organization. Open and transparent communication helps build trust among team members and enables them to work together more effectively. By promoting a culture of shared information, organizations can enhance teamwork and problem-solving.

Aligning Communication with Goals

According to Drucker, communication should be aligned with organizational goals. Leaders should communicate a clear vision and strategy to ensure that all members of the organization understand and work towards the same objectives. This alignment fosters a sense of purpose and direction within the organization.

Adaptability in Communication

Drucker recognized the importance of adapting communication styles to different audiences. Whether addressing employees, stakeholders, or external partners, managers should tailor their communication to the specific needs and expectations of each group. This adaptability enhances the effectiveness of the message.

Regular Feedback

Drucker believed in the value of regular feedback as a form of communication. Managers should provide constructive feedback to employees to help them understand their performance, areas for improvement, and how their work contributes to the overall goals of the organization.

Communication Technology

While Drucker's major works were written before the widespread use of digital communication technologies, his principles can be applied to the challenges and opportunities presented by modern communication tools.

The key is to use technology in a way that enhances rather than hinders effective communication.

Although these principles are not exhaustive, they capture the essence of Drucker's perspective on communication within the broader context of management. It's worth noting that Drucker's ideas on communication were integrated into his holistic approach to effective leadership and organizational success.

▬▬

Thought 3 - On Objectives

Management by objective works -- if you know the objectives. Ninety percent of the time you don't.

MBO ensures that team members are clear about their work and how it benefits the whole organization. It's easy to see why this type of managing makes sense: when the individual parts of an organization work well together, the whole operates smoothly and efficiently. By focusing on what you're trying to achieve, you can quickly distinguish between tasks that you must complete, and those that may not be worth your time.

The goal of MBO is to improve the overall performance of an organization by defining its objectives clearly, and these objectives have to have been agreed to completely by the management, the employees, and the other members of the organization. In other words, it operates on the assumption that, if the goals of the organization are aligned with that of the employees, then achieving these goals through work performance will be more successful.

The Management by Objectives process helps the employees to understand their duties at the workplace.

- KRAs are designed for each employee as per their interest, specialization and educational qualification
- The employees are clear as to what is expected out of them
- Management by Objectives process leads to satisfied employees. It avoids job mismatch and unnecessary confusions later on
- Employees in their own way contribute to the achievement of the goals and objectives of the organization
- Management by Objectives ensures effective communication amongst the employees. It leads to a positive ambience at the workplace
- Management by Objectives leads to well defined hierarchies at the workplace. It ensures transparency at all levels. A supervisor of any organization would never directly interact with the Managing Director in case of queries. He would first meet his reporting boss who would then pass on the message to his senior and so on. Everyone is clear about his position in the organization.
- The MBO Process leads to highly motivated and committed employees
- The MBO Process sets a benchmark for every employee. The superiors set targets for each of the team members, each employee is given a list of specific tasks.

Here are some insights from Peter Drucker on the topic of objectives:

Importance of Objectives

Drucker believed that clear objectives were crucial for the success of any organization. He argued that without a clear understanding of what an organization is trying to achieve, it would be difficult to effectively allocate resources, make decisions, and measure performance.

Guiding Organizational Performance

Objectives serve as a guide for organizational performance. According to Drucker, they provide a sense of direction and purpose, helping individuals within the organization understand what is expected of them and how their efforts contribute to the overall goals.

SMART Objectives

Drucker supported the idea of setting SMART objectives—Specific, Measurable, Achievable, Relevant, and Time-bound. This framework ensures that objectives are clear, quantifiable, realistic, aligned with organizational priorities, and bound by a specific time frame.

Continuous Review and Adjustment

Drucker emphasized the need for continuous review and adjustment of objectives. He believed that organizations should regularly reassess their goals and adapt to changes in the internal and external environment. Flexibility in goal-setting is crucial for staying relevant and responsive to evolving circumstances.

Linkage to Mission and Values

Objectives should be closely linked to an organization's mission and values. Drucker stressed the importance of alignment between what an organization aims to achieve (mission), the principles guiding its actions (values), and the specific targets set (objectives).

Communication and Involvement

Communicating objectives throughout the organization is essential. Drucker argued that everyone within the organization should be aware of the objectives and understand how their individual roles contribute to achieving them. This involvement fosters a sense of purpose and ownership among employees.

Focus on Results

Drucker advocated for a results-oriented approach. Objectives should focus on outcomes rather than just activities. By concentrating on measurable results, organizations can more effectively assess their performance and make informed decisions about future actions.

Social Responsibility

Drucker also believed that organizations have a social responsibility. Objectives should not only be about financial success but also consider the impact of the organization on society. He introduced the concept of the "social responsibility of business"

and urged organizations to contribute positively to the communities in which they operate.

In summary, Peter Drucker's insights on objectives emphasize the critical role they play in guiding organizational performance, the need for clarity and adaptability, and the importance of aligning objectives with the mission, values, and social responsibilities of the organization.

Thought 3 - On Knowledge Workers

In the knowledge society, the most probable assumption and certainly the assumption on which all organizations have to conduct their affairs, is that they need the knowledge worker far more than the knowledge worker needs them.

Knowledge has to be improved, challenged and increased constantly, or it vanishes." Hence, knowledge workers must not take their successes and positions for granted because what got them to the present status of knowledge workers may not help them reach the next higher level if they fail to reinvent themselves regularly.

They must register where they stand in terms of talents, skills, knowledge, and capabilities at all times and document where they would like to be after two or three years. This reflection and planning provide clarity and helps achieve desired objectives. Knowledge workers must continuously document their experiences and accept feedback regularly.

Companies must walk their talk by grooming knowledge workers and identify their expectations and aspirations. Knowledge workers basically look for the right professional ambiance and

talented people to collaborate to create more knowledge. They emphasize quick career growth and prefer working in an organizational environment free from politics.

Most people think that it is the money the knowledge workers crave, which is fallacious. In fact, authentic knowledge workers separate monetary compensation from access to professional challenges. Knowledge workers are the backbone of a modern economy and every organization must realize this fact and treat them as assets rather than as costs.

Companies must realize their needs from time to time and meet the same to ensure better performance and productivity. Above all, they must invest heavily to train and groom them as it is beneficial in the long run for both employers and employees.

Making knowledge workers productive requires changes in attitude, not only on the part of the individual knowledge worker but on the part of the whole organization. Therefore, there is a formidable challenge lying ahead for current coaches to manage both the employees and employers to bring out the desired objectives.

In addition, the present knowledge workers are typically superior to coaches in terms of knowledge. They are also well ahead of their time. Young knowledge workers Gen Y are much more advanced than their older counterparts Baby Boomers as they are more adapt to quick thinking and have had a greater exposure to technological advancements.

They shift companies and acquire knowledge from multiple domains, synthesizing and creating additional knowledge in the process. Some of the young knowledge workers prefer becoming employers to employees.

Hence, managing knowledge workers is a major challenge for them. However, passionate coaches enjoy coaching such knowledgeable coachees. Here are some key insights from Peter Drucker on knowledge workers:

Definition of Knowledge Worker

Drucker introduced the concept of the knowledge worker in his 1959 book, "Landmarks of Tomorrow."

He defined knowledge workers as those who work primarily with information and handle knowledge in their jobs. Unlike manual laborers, knowledge workers deal with tasks that require the application of intellect, analysis, and creativity.

Focus on Productivity and Results

Drucker emphasized that the productivity of knowledge workers is not easily measured by traditional methods used for manual labor. Unlike industrial workers whose output can be easily quantified in terms of physical products, knowledge workers often produce intangible outputs, such as ideas, analyses, and decisions. Therefore, assessing their productivity requires a focus on results rather than the number of hours worked.

Importance of Continuous Learning

Knowledge workers need to engage in continuous learning to stay relevant in their fields. Drucker highlighted the dynamic nature of knowledge and the rapid pace of change in many industries. As a result, knowledge workers must be committed to ongoing education and skill development to adapt to evolving trends and technologies.

Autonomy and Self-Management

Drucker advocated for a management style that gives knowledge workers a high degree of autonomy. He believed that these workers are best positioned to manage themselves, as they possess the expertise and understanding of their work. Instead of strict hierarchical control, Drucker recommended a more collaborative and facilitative approach to managing knowledge workers.

Focus on Contributions and Value

According to Drucker, knowledge workers should be evaluated based on their contributions to the organization and the value they bring. This involves looking at the quality of their ideas, innovations, and problem-solving abilities rather than simply measuring their input in terms of time and effort.

Challenges of Knowledge Work

Drucker acknowledged the challenges associated with knowledge work, including the potential for information overload,

distractions, and the need for effective collaboration. He recognized the importance of creating a conducive work environment that allows knowledge workers to concentrate on their tasks and collaborate effectively.

Role of Managers in Supporting Knowledge Workers

Managers play a crucial role in supporting and enabling the effectiveness of knowledge workers. Drucker emphasized the importance of providing the necessary resources, removing obstacles, and fostering a culture that values knowledge and creativity.

Peter Drucker's insights on knowledge workers remain influential in discussions about modern work environments, especially as the global economy continues to shift toward industries that rely heavily on intellectual contributions and information-based work.

Thought 4 - On Effective Decision

Most discussions of decision making assume that only senior executives make decisions or that only senior executives' decisions matter. This is a dangerous mistake.

Executives do not make a great many decisions, as they concentrate on what is important. They try to make the few important decisions on the highest level of conceptual understanding. They try to find the constants in a situation, to think through what is strategic and generic rather than to "solve problems." They are, therefore, not overly impressed by speed in decision making; rather, they consider virtuosity in manipulating a great many variables a symptom of sloppy thinking.

The following is the outline of how an executive goes about making an effective decision:

- The first questions the effective decision-maker asks are: Is this a generic situation or an exception? Is this something that underlies a great many occurrences? Or is the occurrence a unique event that needs to be dealt with as such? The generic always has to be answered through a rule, a principle. The exceptional can only be handled as such and as it comes.

- The second major element in the decision process is clear specifications as to what the decision has to accomplish. What are the objectives the decision has to reach? What are the minimum goals it has to attain? What are the conditions it has to satisfy? In science these are known as "boundary conditions." A decision, to be effective, needs to satisfy the boundary conditions. It needs to be adequate to its purpose.
- One has to start out with what is right rather than what is acceptable (let alone who is right) precisely because one always has to compromise in the end. But if one does not know what is right to satisfy the specifications and boundary conditions, one cannot distinguish between the right compromise and the wrong compromise—and will end up by making the wrong compromise.
- Converting the decision into action is the fourth major element in the decision process. While thinking through the boundary conditions is the most difficult step in decision-making, converting the decision into effective action is usually the most time-consuming one. Yet a decision will not become effective unless the action commitments have been built into the decision from the start.
- Finally, feedback has to be built into the decision to provide a continual testing, against actual events, of the expectations that underlie the decision. Decisions are made by human beings who are fallible; at their best their works do not last long. Even

the best decision has a high probability of being wrong. Even the most effective one eventually becomes obsolete.

Here are some key principles and quotes attributed to Peter Drucker regarding decision-making:

Decisiveness

Drucker emphasized the importance of making decisions promptly. He believed that effective leaders don't procrastinate but make decisions in a timely manner.

Risks and Innovation

Drucker acknowledged that decision-making involves risks, especially in innovative endeavors. He encouraged leaders to embrace calculated risks, particularly when it comes to fostering innovation and adapting to change.

Information and Analysis

A central theme in Drucker's work is the need for thorough analysis and information before making decisions. He believed in the importance of having relevant data and a clear understanding of the situation.

Understanding the Problem

Drucker highlighted the significance of defining the problem accurately before attempting to solve it. He believed that a well-defined problem is halfway to being solved.

Learning from Mistakes

Drucker recognized that not every decision would be perfect. He encouraged leaders to learn from their mistakes and failures, viewing them as opportunities for improvement.

Decentralized Decision-Making

Drucker advocated for decentralizing decision-making in organizations. He believed that decisions should be made by those closest to the relevant information, as they are often best equipped to make informed choices.

Feedback and Accountability

Drucker emphasized the importance of feedback mechanisms to evaluate the outcomes of decisions. Leaders should hold themselves and their teams accountable for the consequences of their choices.

Prioritization

According to Drucker, effective decision-making involves setting priorities. Leaders must distinguish between what is important and what is merely urgent, focusing their attention on high-priority tasks.

Ethical Considerations

Drucker believed that ethical considerations should be integral to decision-making. Leaders should make decisions that align with ethical principles and contribute positively to society.

Communication

Drucker stressed the importance of clear communication in the decision-making process. Leaders should ensure that the rationale behind decisions is effectively communicated to those affected by them.

It's important to note that these principles are part of a broader management philosophy that Drucker developed over his career. His ideas have had a lasting impact on the field of management, and many of his insights remain relevant to leaders and decision-makers today.

▬▬

Thought 5 - On Managing Time

Time is the scarcest resource, and unless it is managed, nothing else can be managed. The analysis of one's time, moreover, is the one easily accessible and yet systematic way to analyze one's work and to think through what really matters in it.

Time. It's the one unique resource that we cannot replace or replenish. Every minute that we spend doing one thing, is a minute that we cannot spend doing something else. We cannot go back to yesterday and change the way we spent our time, and neither can we look into the future to see how much time we still have in this life. Realistically speaking, the only time we have is now, so if we want to accomplish something we are going to need to optimize for it. The basic process to increase the effectiveness of our time is simple: record it, manage it, and consolidate it.

Step 1: Record it

The very first step to managing your time is knowing how you spend it. So, keep a basic log or calendar, and simply record how long you spend doing what activity. If you're trying to record your time for your professional life, it can be revealing to see how much time you spent on less-than-useful meetings or answering emails. Likewise, you might be shocked by how little time you

actually spend on “work.” If you’re doing this exercise in different setting it can still interesting to see what things you spend time on.

Especially if you’re trying to do things next to your job, say launch a start-up, you need to make sure that the limited time you have is going towards the right activities. And the only way to do that is to start tracking it.

Step 2: Manage it

Having recorded your time log for a while you can start to tally up the numbers and see how you spend your time on per day or per week basis. You might want to do a small analysis and make categories. For example: meetings, reporting, work on project X, briefing person Y, et cetera. Then, you can start to manage it. The first thing you can look at is activities that add no, or limited value, and start to remove them completely from your calendar. The second thing to look at, especially in a professional context, is to see which activities can or should be done by others.

Oftentimes people are in the habit of doing all the activities themselves, while there might be persons better suited to do it, or when delegation might be better. If you’re not adding value, or if someone else adds just as much value as you do (for example: a subordinate) then consider delegating it.

Finally, check whether you’re the one creating time waste for others. Are you the one scheduling needlessly large meetings? Or are you the one requesting detailed reports you never read? Time

you force others to waste is still wasted time, and not something that is very effective for your team or organization.

Step 3: Consolidate it

Being effective equals possessing consolidated stretches of time. What this means is that you should schedule, and block, sessions that are exclusively devoted to deep work. Uninterrupted, unconnected time where you can truly focus and do the work. If you only have time available in little bits (15-30 minutes each) or you're constantly interrupted by phone calls, emails, or colleagues you will not be productive or effective.

To be effective and productive you need consolidated blocks of time. That way, even if you don't have a lot of time in absolute numbers, you can be sure you will be more effective than most people. Small bits focus time every now and then is not nearly as effective as a consolidated uninterrupted period of time.

▬▬

Thought 6 - On Planning

Plans are only good intentions unless they immediately degenerate into hard work.

Although it may seem oxymoronic and to some just plain moronic, there is no way to develop an effective strategic plan without planning to plan. Planning process is a complex endeavor that involves multiple stakeholders working together to make important decisions about service priorities, values, and organizational capacity.

These are critical issues, and the processes used to address them will have an effect on the decisions that are made. If you fail to involve all of the stakeholders, your plan may be too limited in scope or vision.

In his definition of planning, Peter Drucker offers a holistic view about this term. "Planning is a continuous process of making present entrepreneurial decisions systematically and with best possible knowledge of their futurity, organizing systematically the efforts needed to carry out these. He listed four misconceptions arising from the term "strategic planning." He said:

- Strategic planning is not a box of tricks, a bundle of techniques

- Strategic planning is not forecasting
- Strategic planning does not deal with future decisions
- Strategic planning is not an attempt to eliminate risk

Here are some key insights from Peter Drucker on planning:

Importance of Planning

Drucker emphasized the crucial role of planning in effective management. He believed that planning is an essential function that helps organizations anticipate and prepare for the future. According to him, planning is a disciplined effort to produce decisions and actions that guide and shape what an organization is, what it does, and why it does it.

Adaptability and Flexibility

Drucker recognized the dynamic nature of the business environment. He advocated for plans that are flexible and adaptable. In a rapidly changing world, rigid plans may become obsolete quickly. Drucker stressed the need for organizations to be agile and ready to adjust their plans based on evolving circumstances.

Focus on Opportunities

Drucker encouraged managers to focus not just on solving problems but also on identifying and capitalizing on opportunities. He believed that effective planning involves looking ahead and recognizing possibilities for growth and improvement. Managers

should allocate resources to exploit opportunities rather than just solving existing issues.

Involvement of Key Stakeholders

Drucker emphasized the importance of involving key stakeholders in the planning process. This includes employees, customers, suppliers, and other relevant parties. Inclusion fosters a sense of ownership and commitment, making it more likely for plans to be successfully implemented.

Setting Objectives

Drucker stressed the significance of clearly defined objectives in the planning process. Objectives should be specific, measurable, achievable, relevant, and time-bound (SMART). Having well-defined objectives provides a clear direction for the organization and helps in evaluating performance.

Decentralized Planning

Drucker was an advocate of decentralization in planning. He believed that planning should not be solely a top-down process but should involve input from various levels within an organization. This allows for a more comprehensive understanding of issues and encourages creativity and innovation.

Continuous Monitoring and Evaluation

Drucker emphasized that planning is an ongoing process. Organizations should continuously monitor their performance and evaluate whether they are on track to achieve their objectives.

Regular feedback and adjustments are essential to ensure that plans remain relevant in a changing environment.

In summary, Peter Drucker viewed planning as a fundamental function of management that should be dynamic, flexible, and focused on both solving problems and seizing opportunities. His insights on planning continue to be influential in the field of management.

▬▬

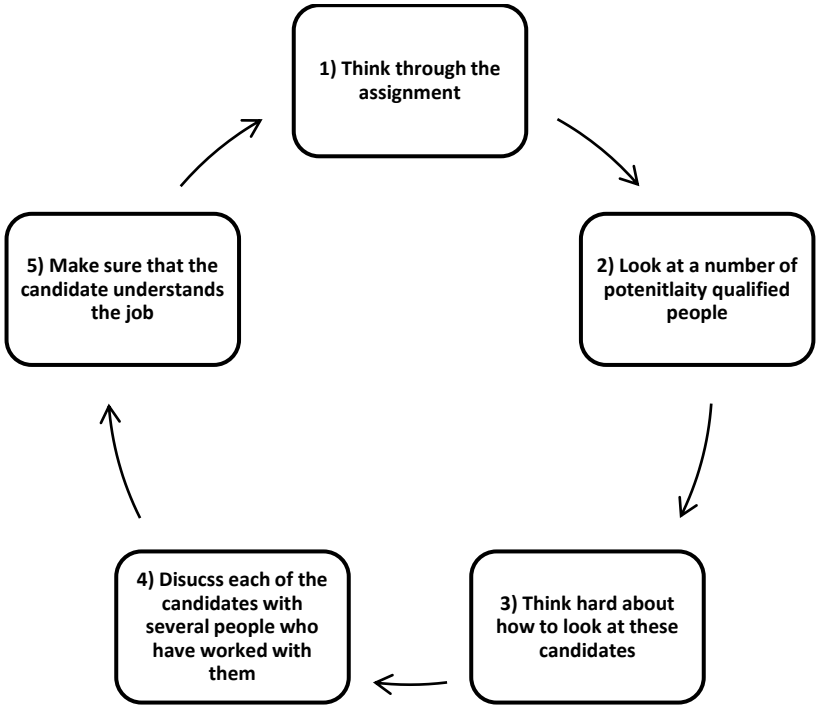

Thought 7 - On People Decisions

The most important decisions in organizations are people decisions, and yet only the military, and only recently, has begun to ask, "If we assign this general to lead this base, what do we expect him to accomplish?".

Drucker said that of all the decisions an executive makes, none is as important as the decisions about people, because they determine the performance capacity of the organization.

Executives spend more time on managing people and making people decisions than on anything else-and they should. No other decisions are so long lasting in their consequences or so difficult to unmake. And yet, by and large, executives make poor promotion and staffing decisions. By all accounts, their batting average is not better than .333 at most one-third of such decisions turn out right; one third are minimally effective; and one-third are out-right failures.

The Decision Steps

Drucker emphasized the significance of effective management of people within an organization, recognizing that the success of any enterprise is deeply intertwined with the capabilities, motivations, and actions of its individuals. Here are some key points Drucker made regarding people decisions:

The Importance of People

Drucker emphasized that people are the most crucial asset of any organization. He argued that it is the people within an organization who determine its success or failure. As such, making wise decisions about people is vital for the overall health and effectiveness of an enterprise.

Hiring and Selecting Talent

Drucker believed that the process of hiring and selecting employees is a critical aspect of management. He advocated for a thorough and thoughtful approach to recruitment, emphasizing the importance of identifying individuals whose skills, values, and aspirations align with the organization's goals and culture.

Building on Strengths

Drucker encouraged managers to focus on the strengths of their employees rather than trying to fix weaknesses. He believed that individuals excel when they leverage their strengths and that organizations should strive to create environments where employees can maximize their potential.

Development and Training

According to Drucker, investing in the development and training of employees is essential. He recognized the dynamic nature of the business environment and believed that organizations and individuals must continuously adapt and learn to stay relevant.

Motivation and Engagement

Drucker highlighted the importance of motivating and engaging employees. He believed that people perform at their best when they are personally motivated and find meaning in their work. Effective communication, recognition, and a positive work environment were key elements in fostering employee motivation.

Decisiveness in People Decisions

Drucker stressed that managers should make people decisions promptly and decisively. Procrastination or indecision in matters related to personnel can lead to inefficiencies and negatively impact the overall performance of the organization.

Alignment with Organizational Goals

Drucker emphasized the need for people decisions to align with the broader goals and strategy of the organization. This includes ensuring that the skills, roles, and aspirations of individuals are in harmony with the direction in which the organization is heading.

Feedback and Communication

Regular feedback and open communication were viewed by Drucker as crucial components of effective people management. Managers should provide constructive feedback, encourage dialogue, and create an atmosphere of transparency within the organization.

In summary, Peter Drucker underscored the strategic importance of people decisions in the success of organizations. His insights continue to be influential in guiding managers and leaders in their approach to managing and developing their most valuable asset—their people.

Thought 8 - On Strategy

Strategy is a commodity, execution is an art.

Let's face it: there is no clearer proof that a strategy has been communicated properly than when a manufacturing supplier, in another country, with a different native language, uses it to correct rightly the founder of the company.

A strategy comes to life through its ability to influence thousands of decisions, both big and small, made by employees throughout an organization. A strategy is, at its core, a guide to behavior. A good strategy drives actions that differentiate the company and produce financial success. A bad strategy drives actions that lead to a less competitive, less differentiated position.

Peter Drucker's definition of strategy: "A pattern of activities that seek to achieve the objectives of the organization and adapt its scope, resources and operations to environmental changes in the long term."

Drucker looked at a company's objectives and whether they matched the business in which the company was engaged, what their business should be, who would be their customers and what their customers wanted. He also did not ignore if their business

contributed to society. This information was needed as it affected strategy.

Drucker recognized that any strategy had to consider the answers to four basic questions:

- What opportunities the organization wants to pursue and what risks it is able and willing to accept?
- What is the scope and structure of the strategy, including the right balance among specialization, diversification and integration?
- What are the acceptable trade-offs between time and money between in-house execution versus merger, acquisition, joint venture or other means to reach an objective?
- Is the organizational structure appropriate to economic realities, opportunities and performance expectations?

The quote "Strategy is a commodity, execution is an art" emphasizes the importance of effective implementation and execution in achieving success, suggesting that having a good strategy alone is not enough.

Here's a breakdown:

Strategy is a commodity

This part suggests that strategies, or plans of action, are common and can be found relatively easily. Many organizations may have similar or comparable strategies. It implies that

developing a strategy is a fundamental and accessible aspect of management.

Execution is an art

In contrast, the execution of a strategy is portrayed as an art form. This implies that successfully implementing a strategy requires skill, creativity, and perhaps a level of finesse. Execution involves turning a strategy into action, overcoming challenges, adapting to unforeseen circumstances, and ultimately achieving the desired outcomes.

In essence, Drucker's quote underscores the idea that while strategic planning is essential, the real challenge lies in the ability to execute the plan effectively. Success is not just about having a good strategy but also about the skillful and creative implementation of that strategy.

This perspective aligns with the recognition that translating ideas into action is a complex and nuanced process that requires a combination of leadership, adaptability, and operational excellence.

▬▬

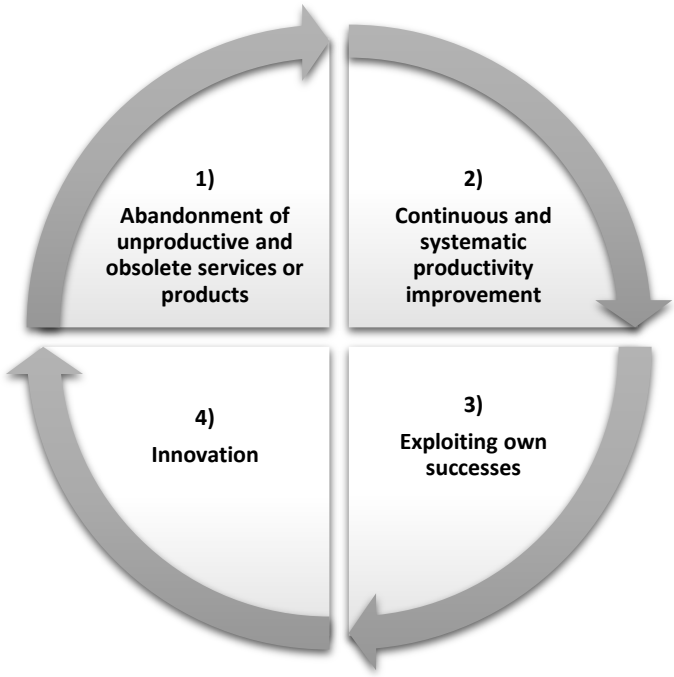

Thought 9 - On Change

Change is the norm; unless an organization sees that its task is to lead change, that organization will not survive.

Drucker outlined four distinct but highly related tasks for making effective change happen. He said; we cannot manage change, we can only handle it by endeavoring to anticipate its 'twists and turns' and need to be flexible plus to see change as an opportunity, in a positive light. Change has become the norm. We need to handle it to survive and thrive in a turbulent, disruptive future. He argues that in a world where change is constant and inevitable, organizations must be ‘Change Leaders’ in order to survive, identifying four essential requirements:

- Policies to make the future
- Systematic methods to look for and to anticipate change
- The right way to introduce change, both within and outside the organization
- Policies to balance change and continuity

The Framework of Change

1) Abandonment of unproductive and obsolete services or products	This involves focusing on: • Building on your strengths, ie work on the areas of the organization which do extremely well and which customers want, ie willing to pay for. Try to improve performance in these areas. • Outsourcing of mission-critical support activities that others can do better than you
2) Continuous and systematic productivity improvement	The aim is to systematically improve the productivity of all assets including products and services, production processes, technologies, people, capital, etc. Capital is shown by return on invested

	capital. Training and retraining are important for continuous improvement.
3) Exploiting own success	To look for unexpected successes, the following questions can help: • What would it mean to us if we exploited it? • Where could it lead us? • What would we have to do to convert it into an opportunity? • How do we go about it? This means, first, management need to set aside specific time in which to discuss unexpected successes; and secondly, an individual or team should always be assigned to analyze an unexpected success and to think through how it could be exploited..."
4) Innovation	Innovation is about creating new value for customers. The key question is 'Will this make a difference that is considered valuable to existing and/or potential customers?'

Drucker has developed Paradigm of Change model. It has been used as a framework in organizations that want the best of design as such.

▬▬

Thought 10 - On Measuring What Matters Most

What gets measured, gets managed.

"What gets measured, gets managed" is a famous quote from Peter Drucker's 1954 book "The Practice of Management.", but before we dive into possible measurements, we need to reflect upon what we already know about measures that are currently used to evaluate an organization. The best departure point for this exploration is investigating why and how these measures originated.

What is Measurement?

Measurements are an object of common managerial proverbs: "you can't improve, what you can't measure" and "what gets measured, gets done." But, when it comes to performance management, some might feel that this philosophy is inadequate. People are so much more than data. And teams have more productive things to do than bury themselves in employee performance metrics.

A measurements program translates corporate goals and objectives into action. It makes progress toward goals visible; allowing for clear communication, objective analysis and fact-based decision making. Analyzing measurements information

helps satisfactory results continue and identify es opportunities for improving results.

Before measuring, it is important to decide why the measurements are being made. A measurement is one way to understand how well a process is working and what a process is doing. Measurements can also identify problems or show progress towards goals. Making measurements visible and understood by the people who contribute to the result being measured can motivate change in an organization. Measurements provide the most useful basis for decision making.

Before deciding what to measure, ask yourself this question: "If the measurement goals are achieved, will you be satisfied?" This makes it clear that goals and objectives for the organization must be set before measurement planning can begin.

Typical objectives might include increasing short- or long-term profit, market share, customer satisfaction, reliability, or effectiveness, decreasing cycle time, defects, re-work, costs or waste. How do you decide where to start and where to focus?

To maintain current performance or to improve beyond the current performance requires that goals be set for each measured quantity. In setting goals be sure to consider each of the following factors:

- Is the measurement being taken to improve performance? If so, an improvement goal must be set. Otherwise, if the

measurement is taken to maintain the current level of performance, it is satisfactory to set a conservative "alarm threshold" below which no action is required.

- What is the current level of performance? If it is satisfactory, then only modest improvement goal needs to be set. If current performance is poor, then set aggressive improvement goals. Consider your performance relative to the competition's performance or other relevant benchmarks when making these decisions. Keep in mind that the competition will continue to improve and a breakthrough can occur at any time.
- How difficult will it be to achieve an improvement? If large gains are possible, it makes sense to achieve them. If it is very difficult to make progress, then a more modest goal can be set.
- What resources are available to achieve the goal? Setting a goal that requires more resources than have been made available to address the improvement will only frustrate the people in the organization.
- What goal are the people who must do the work willing to support? If the goal is set out of reach or the metric is not seen as relevant to the business, then the people in the organization become disconnected from the goal. When this happens, no one is working to achieve the goal and failure is assured.

Drucker emphasized the importance of measurement in assessing performance and making informed decisions. Here are some key insights from Drucker on measuring:

Clarity of Objectives

Drucker stressed the importance of clearly defining objectives before implementing any measurement system. Organizations should have a clear understanding of what they are trying to achieve, and measurements should align with these objectives.

Focus on Results

Drucker advocated for a results-oriented approach to measurement. He believed that the focus should be on outcomes and achievements rather than on activities. Measuring the right results helps organizations stay aligned with their strategic goals.

Key Performance Indicators (KPIs)

Drucker popularized the concept of Key Performance Indicators (KPIs). He recommended identifying a small set of critical metrics that directly reflect the success or failure of an organization in achieving its objectives. These indicators should be meaningful and actionable.

Quantifiable and Qualitative Measures

While Drucker recognized the importance of quantitative measures, he also acknowledged the value of qualitative indicators. Not everything that matters can be easily quantified, and organizations should consider a balanced approach that includes both quantitative and qualitative assessments.

Continuous Improvement

Drucker believed that measurement is not a one-time activity but an ongoing process. Organizations should regularly review and update their measurement systems to adapt to changing circumstances and to foster continuous improvement.

Avoiding Measurement Overload

Drucker cautioned against excessive measurement, emphasizing the need to strike a balance. Too many metrics can lead to confusion and a lack of focus. It's important to choose measures judiciously and avoid overwhelming the organization with unnecessary data.

Feedback and Learning

Drucker saw measurement as a tool for providing feedback and facilitating learning. Organizations should use measurement results to identify areas for improvement, adjust strategies, and learn from both successes and failures.

Overall, Drucker's perspective on measurement underscores its critical role in effective management. By measuring the right things and using the results to drive decision-making and improvement, organizations can enhance their performance and achieve long-term success.

▬▬

Thought 11 - On Culture

Culture eats strategy for breakfast.

Culture may be broadly defined to include all the beliefs, values, attitudes, rituals, and behavior patterns that people in an organization share. Despite the interest in values as a lever of leadership, people's beliefs, values, and attitudes are extremely difficult to change directly. And meddling with them verges on dubious ethics. Similarly, trying to tell people how to feel is futile.

The culture of an organization is its personality and character. Key factors in an organization's culture include its history and environment as well as the people who lead and work for it.

On the other hand, specific behaviors can be described, modeled, and taught. Practical leaders focus on the practices that are widely accepted throughout their organizations. In this light, culture is "the way we work around here."

Culture is the set of behaviors that are widely practiced throughout an organization.

For example, telling people to trust one another a feeling is not likely to have any significant impact. Nor is the statement, we value trust. But demanding that we make no commitments that we cannot keep a behavior ensures that people act in a trustworthy manner.

Once behaviors change, values and attitudes generally follow. In this example, once people behave in a trustworthy manner, they will learn to trust one another.

Culture applies to everyone in an organization. It does not include profession-specific practices. For example, a culture of customer focus should be widespread. But the specific practice of working with clients to identify their needs is limited to one profession within an organization (the "Consultancy," or sales force), and is, therefore, outside the scope of culture.

The phrase "***culture eats strategy for breakfast***" highlights the importance of organizational culture in influencing the success or failure of strategic initiatives. In essence, the saying suggests that no matter how well-crafted a strategic plan may be, the organizational culture can have a more significant impact on the overall success of that plan. Here's a breakdown of what this phrase implies:

Culture as a Social Glue

Drucker believed that culture serves as a social glue that holds an organization together. It provides a common set of values

and norms that guide employees in their actions and decisions. A strong organizational culture, according to Drucker, contributes to a sense of shared purpose and identity.

Culture and Strategy Alignment

Drucker highlighted the importance of aligning organizational culture with strategic objectives. He argued that a company's culture should support and reinforce its strategic goals. When there is a misalignment between culture and strategy, it can lead to confusion, resistance, and difficulties in implementing strategic initiatives. For a strategy to be successful, it needs to align with and be supported by the existing culture of the organization. If there is a misalignment, the cultural norms and behaviors may hinder the implementation of the strategy.

Cultural Barriers

Even the most well-thought-out strategy can face challenges if it goes against the established norms and values within an organization. If the culture resists change or is incompatible with the proposed strategy, it can undermine the implementation process.

Management's Role in Shaping Culture

Drucker believed that leaders and managers play a crucial role in shaping and maintaining organizational culture. They set the tone for the organization, establish values, and model the behavior they expect from employees. Effective management

involves fostering a culture that aligns with the organization's mission and goals.

Adaptability and Flexibility

In a rapidly changing business environment, Drucker emphasized the need for organizational cultures that are adaptable and flexible. He recognized that successful organizations are those that can evolve and adjust to new challenges, and this requires a culture that embraces change and innovation.

Focus on People

Drucker was known for his people-centric approach to management. He believed that organizational culture should prioritize the development and well-being of employees. A positive and supportive culture enhances employee satisfaction, engagement, and productivity. The phrase underscores the significance of people and their collective mindset within an organization. No matter how strategic and well-designed a plan may be, it ultimately relies on the people within the organization to execute it.

Culture as a Powerful Force

Organizational culture refers to the shared values, beliefs, and behaviors that shape how people in an organization interact and work. The idea is that the culture of an organization has a powerful and often underestimated influence on its outcomes.

In practice, successful organizations recognize the importance of both strategy and culture. They strive to create a culture that is aligned with their strategic goals and fosters an environment conducive to innovation, collaboration, and adaptability. It's not a matter of choosing between strategy and culture but rather ensuring that they complement and reinforce each other.

It's important to note that while Drucker acknowledged the significance of culture, his primary focus was on how management practices and principles contribute to organizational effectiveness. His insights on culture should be considered within the broader context of his teachings on management and leadership.

In summary, the phrase "culture eats strategy for breakfast" serves as a reminder to leaders that understanding and working with the existing organizational culture is crucial for the effective implementation of strategic plans.

▬▬

Thought 11 - On Meetings

Meetings are a symptom of bad organization.

The fewer the meetings the better.

Peter Drucker really said it best. We cannot agree with this statement enough. Time management is something Peter Drucker wrote about often and it may be the most important concept in The Effective Executive. Executives are busy. Often times they get trapped in a vortex of meetings and briefings only to react to whatever they believe to be the most pressing issue at a given time.

To better manage time, Drucker recommends three key strategies:

- Create unbroken blocks for individual think time, preferably during the most lucid time of day; these pockets of quietude might be only ninety minutes, but even the busiest executive must do them with regularity.
- Create chunks of deliberately unstructured time for people and the inevitable stuff that comes up.
- Engage in meetings that matter, making particular use of carefully constructed standing meetings that can be the heartbeat of dialogue, debate, and decision; and use some of your think time to prepare and follow up.

Peter Drucker understood the burden a poor meeting places on an organization. For this reason, he advises a two-component system for more effective meetings:

- Preparation with a clear purpose in mind (i.e. “Why are we having this meeting?”)
- Disciplined follow-up (i.e. What are the actions, who is responsible for them, and when will they get done?)

Most meetings have agendas, but few are actually followed. In the same light, most meetings take actions, but follow up is usually late or does not happen at all. Drucker believes it is up to the executive to ensure both of happen.

The key to successful meetings, in Drucker’s eyes, was to make sure that they became “work sessions rather than bull sessions.”

In The Effective Executive, Drucker put meetings into the following categories, and also offered some specific operating instructions for each:

- “A meeting to prepare a statement, an announcement, or a press release. For this to be productive, one member has to prepare a draft beforehand.”
- “A meeting to make an announcement—for example, an organizational change. This meeting should be confined to the announcement and a discussion about it.”

- “A meeting in which one member reports. Nothing but the report should be discussed.”
- “A meeting in which several or all members report. Either there should be no discussion at all or the discussion should be limited to questions for clarification.”
- “A meeting to inform the convening executive. The executive should listen and ask questions.”
- “A meeting whose only function is to allow the participants to be in the executive’s presence. . . . .There is no way to make these meetings productive. They are the penalties of rank.”

In summary, Excessive meetings are a symptom of a major organizational problem. The company's organizational structure must be redesigned to achieve desired results. The right organizational structure does not guarantee success. The wrong organizational structure guarantees nonperformance and an epidemic of meetings.

▬▬

Final Thoughts

In light of Peter Drucker's wise words applied to today's context, we would sum up the key takeaways.

Knowledge has now become the primary factor of in managing all aspects of an organization, both capital and labor. That means that knowledge is now seen as the basic economic resource, that needs to be managed. Leaders are responsible for the deployment and optimization of knowledge. Where there is effective management of knowledge, other resources can always be obtained. People are assets to be empowered, not machines to be commanded.

His philosophy was not blind market rationality, but "right thinking", that must originate from understanding purpose and setting goals based on that purpose. A clear sense of purpose and a set of common values is what motivates people to work effectively together.

"To be effective, every knowledge worker, and especially every executive, needs to be able to dispose of time in fairly large chunks. To have small dribs and drabs of time at his disposal will not be sufficient even if the total is an impressive number of hours."

About Authors

Prof. Dr. M. Amr Sadik, is a veteran, Practical-academic, seasoned and accomplished HR and Management senior executive with almost 4 decades with local, regional and global companies in different industries in various countries, coupled with international awards and recognitions.

He is a luminary in the world of Human Resources and a titan in his field. He was selected as a member of the Harvard Business Review Advisory Council, an opt-in research community of business professionals, and a Fellow member of the Royal Society of Arts, Manufactures and Commerce in UK.

Prof. Sadik is the Co-founder, Vice President, Educators Learning Solutions Ltd, (Educators) UK, and holds different positions such as Regional Director-North Africa for International Association for Quality Assurance in Higher Education, USA, Collegiate Council Member & Professor of HR Management, Global University of Science & Technology, Latvia, Executive Member, Ajeenkya D Y Patil University, International Academic Council (IAC), India, Professor of Management, The George Washington University of Peace, USA, Regional Director-Egypt, Chartered Institute of

Management & Leadership, USA, Vice President of Chartered Institute of Leadership & Governance, USA, and last but not least Board & Advisory Committee Member at Arab Trainers Union, Jordan.

In 1997 he was nominated for Professional Excellence Award in HR from "SHRM" in USA, and in 2006 for Sheikh Rashid Bin Maktoum Award in the United Arab Emirates as the Best Arab Manager. The Stevies Award laureate in 2007 as first Egyptian/Arab winner, and who was ranked among the top 20 HR Most International Influential Thinkers in 2014 from UK. In 2015 he received Peter F. Drucker in Management, from UOSF, Panama. Furthermore, he was ranked as one of Top 100 Thought Leader in HR and Top 25 Thought Leader in Careers by Thinker 360 in USA.

Prof. Sadik, is a regular international contributor at HR-Future magazine in South Africa, and published 4 books in India, Germany and South Africa. He frequently called in HR conferences and summits to opine in current practices and provide his insights. As adjunct professor he is associated with various business and management schools to teach at post-graduate studies. He used to be associated with Frankfort School of Finance and Management, International Advisory Services, in Germany as HR and Training expert and Consultant.

Ms. Noha A. Alghazaly, is the Learning & Development Manager at, Educators Learning Solutions Ltd, (Educators) UK, with

considerable years in learning and development business. She is master's degree holder and associate member at Chartered Institute of Management and Leadership CIML as well as Chartered Institute of Leadership and Governance, USA.

In addition, she is also a Certified Training Manager from Arab Trainers Union, Jordan, and international member of the International Council for Education, Research and Training (ICERT), India,

She analyzes training needs to develop new training programs or modify and improve existing programs, evaluate instructor performance and the effectiveness of training programs, providing recommendations for improvement.

Furthermore, she plans, develop, and provide training and staff development programs, using knowledge of the effectiveness of methods such as classroom training, demonstrations, on-the-job training, meetings, conferences, and workshops.
